Team 45 Design Challenge

1. The team split up the deliverables well. Each member has a different strength, and each member was able to perform tasks that played to those strengths. The team also communicated the progress of each task well to each other.
2. The team could improve on RobotC implementation and proficiency, as the program was the weakness of the design, and time management for the testing. There was a disconnect between the time to finish the code and finishing the building of the vehicle.
